SUMMARY

Full-stack Developer with frontend expertise and 3 years of industry experience as a Software Developer (since 2023), building zero-to-one SaaS systems at startups: agentic-coding desktops, metadata-driven CRMs, node-based workflow engines, and reusable schema-driven UI platforms. Ships React and TypeScript UIs and owns Go services end-to-end (Auth with OIDC, Invoice, E-Signature, and Layout) backed by PostgreSQL, gRPC, and Kubernetes. Comfortable owning product and UX end-to-end without Figma handoffs, working directly with founders and CTO to ship from zero. Known as a strong debugger of complex UI issues and a developer who ships well-versioned, semver-released packages.

SKILLS

Languages: TypeScript, JavaScript (ES6+), Go, Node.js, HTML5, CSS3, SQL, C++

Frontend: React.js (18 and 19), Next.js 15, Vue.js, Tailwind CSS, Ant Design v5, Styled Components, Material UI

State and Data: Redux, Zustand, React Query (TanStack), Axios

Specialized UI: React Flow, CodeMirror 6, TipTap, Quill, Xterm.js, Mermaid, Three.js

Real-time: MQTT, WebSockets, LiveKit

Desktop: Tauri 2 (Rust shell), Electron-class native applications

Backend: Go, GORM, gRPC, REST APIs, PostgreSQL, Atlas migrations, Dependency Injection (uber-go/dig)

Auth and Security: OIDC (OpenID Connect), OAuth 2.0, JWT, RBAC, ABAC, Session management

Infrastructure and DevOps: Docker, Kubernetes, Helm, Bazel, Microservices, Service-oriented architecture

Frontend Tooling: pnpm, Turborepo, Changesets, tsup, Vite, Webpack, ESLint, Sentry

Other: Git, Chrome Extensions (MV3), Monorepo architecture, Performance optimization, Cross-browser debugging

EXPERIENCE

SuperAGI

Bangalore, India

SDE-2, Full-stack

January 2025 to Present

- Built SuperAGI Chat Desktop using Tauri 2, React 18, and TypeScript — a native desktop client shipping for macOS, Windows, and Linux (Ubuntu) from a single codebase.
- Integrated mention-based agent invocation (TipTap), MQTT real-time chat, and LiveKit-powered voice and video meetings into one unified surface.
- Embedded an in-house Coder Agent providing an agentic-coding workflow comparable to Cursor, Claude Code, and Codex: Plan/Ask/Edit modes, embedded terminal (Xterm.js with tauri-pty), code-diff side drawer, per-tool permissions system, parallel multi-agent threads with isolated context, and one-click pull request creation — all without leaving the application.
- Architected Agent Builder, a node-based DAG workflow automation engine, from scratch with React Flow, React 19, and Next.js 15.

- Engineered an extensible node-type system (triggers, conditional branches, if/else, time delays, webhooks, agent actions) with a connector-pattern integration layer and a schema-cached metadata model — letting users compose dozens of nodes in minutes with every node, connector, and configuration form fully reusable.
- Created a fully metadata-driven CRM from the ground up (View Service and CRM Service) with zero hardcoded UI. Users can create custom objects supporting 20 to 25 attribute types, with every form, table, and detail view generated dynamically from the schema.
- Engineered a reusable data-table component powering any entity in SuperSales and CRM (sequences, prospects, lists, custom objects).
- Implemented drag-to-reorder columns, hide/show columns, resizable widths, row-grouping, Kanban view, advanced multi-condition filters, and a library of reusable row and bulk action components (add-to-sequence, add-to-list, bulk edit, export, assign, quick-call, quick-email) that any consuming surface can compose without rewriting.
- Designed the Layout Service (frontend and backend) as a schema-driven rendering engine exposing a stable contract consumed by multiple internal services beyond CRM. Any service can declare its layout in metadata and get fully rendered forms, tables, and detail views for free, eliminating duplicate UI code platform-wide.
- Developed end-to-end Invoice Service (frontend and backend) and E-Signature Service, integrated into the SuperSales billing flow.
- Architected the Auth-v2 backend service in Go (GORM with PostgreSQL, gRPC and REST handlers, deployed via Helm on Kubernetes) with OIDC (OpenID Connect) for federated identity and login flows.
- Implemented the corresponding frontend RBAC and ABAC access control, gating routes, components, and actions based on user roles and contextual attributes.
- Bootstrapped the entire superagi-ui monorepo from scratch — set up the pnpm and Turborepo workspace, Changesets-driven semver release flow, shared ESLint and TypeScript configurations, and the package architecture hosting more than 15 reusable connector packages including automations, coder, block-editor, email-builder, and react-components.
- Established a domain-grouped, strongly typed package architecture now actively contributed to and consumed by engineers across multiple teams — cut feature delivery time by 40 percent.
- Shipped end-to-end SuperSales features: sequence management, multi-channel outreach (Slack, Email, LinkedIn), domain and mailbox provisioning for cold-outreach onboarding, and a Salesforce Chrome Extension (Manifest V3) for enterprise clients.
- Migrated critical workflows from Vue.js to React, achieving 35 percent rendering performance improvement on complex flow graphs.
- Owned product and UI/UX design end-to-end on most modules. Delivered polished, intuitive interfaces without Figma handoffs, collaborating directly with the Founder and CTO on scope, flows, and visual design.

WE-Matter (Fortune Super 30)

Mumbai, India

SDE-1

September 2023 to January 2025

- Launched a comprehensive survey platform supporting 4 distinct user roles (admin, client, superadmin, user) and managing more than 200 active surveys.
- Deployed an automated reminder system processing more than 5,000 notifications per day across Gmail, WhatsApp, and SMS with a 95 percent delivery rate.
- Developed a data-rich analytics dashboard with Redux serving more than 500 concurrent users with real-time response tracking.
- Generated PDF reports with embedded charts, processing more than 1,000 exports per month using EJS templating.

- Leveraged Styled Components, Ant Design, and React Query to deliver responsive interfaces and improved load times by 45 percent.

EDUCATION

Lovely Professional University

Bachelor of Technology

CGPA: 8.65

Phagwara, India

August 2020 to July 2023

CERTIFICATIONS

The Web Developer Bootcamp, Udemy (November 2022)

C++ Programming, Udemy (May 2022)
